2014/2015 Annual Information

Scientific Information - Science Activities in Previous Year

Project Name/Number:

866.10.101

Discipline:

Individual project under Netherlands Polar Programme: Temporal dynamics of the climate gas dimethyl sulphide (DMS) and related compounds in a changing Antarctic sea-ice environment.

Principal Investigator:

Dr. J. Stefels (University of Groningen)

Main Activity/ Remarks:

In polar regions, major climate-gas exchange events occur during the period of sea-ice melt and associated growth of phytoplankton. Important compounds are dimethylsulphide (DMS), a potentially climate-cooling gas, and bromocarbons, precursors of the reactive compound bromine oxide. On a global scale, DMS is thought to counterbalance greenhouse gases, such as CO₂. However, recent studies have shown that bromine chemistry not only leads to loss of ozone, but also to loss of DMS, thereby reducing the latter's cooling effect. Such interactions have important implications for climate models, but ground-truth data to validate such models are lacking. This project aims to fill that gap, by doing time-series measurements of DMS and associated compounds at the Rothera Time Series (RaTS) site. High fluxes of DMS are episodic and have been found associated with the melting of sea ice. With major changes in sea-ice coverage taking place at the west side of the Antarctic Peninsula, Rothera is extremely well situated to study the effect of retreating sea ice on climate-gas production. We measure both the water and ice phase for its DMS and related-compounds content. The methods are based on recently developed methods using stable-isotope additions and mass spectrometry. Data will be related to the community structure and physicochemical characteristics of the area. This work will provide the first polar DMS time series ever and will form an important input for new polar coupled-climate models.

Areas of Operation

Rothera

Project Name/Number:

866.10.103

Discipline:

Individual project under Netherlands Polar Programme: Seasonality of iron and other trace metals in relation to the rapidly changing ice/water cycle and plankton dynamics of the West Antarctic Peninsula

Principal Investigator:

Prof.dr. H.J.W. de Baar (University of Groningen)

Main Activity/ Remarks:

The West Antarctic Peninsula is the most rapidly warming region in the Southern hemisphere, with glacial retreat and ice shelf collapse causing major changes in the marine environment. We make a systematic investigation of iron, aluminium, manganese and related bio-essential trace metals Co, Ni, Cu, Zn in the water column and the sea-ice of Marguerite Bay throughout two complete annual cycles. This study will serve as a first assessment of the distribution and cycling of iron and the other trace metals in relation to the ice/water cycle and the biological cycle. We test the working hypothesis that the annual collapse of the bloom of large diatoms at the end of the summer is due to depletion of dissolved iron by the bloom itself. This first study will serve as the baseline for future assessment of changes in relation to the major climate changes at the West Antarctic Peninsula.

Areas of Operation

Rothera

Project Name/Number:	866.13.006
Discipline:	Individual project under Netherlands Polar Programme: Uptake of anthropogenic carbon dioxide, chemical changes and effects on the marine ecosystem in Marguerite Bay, Rothera Research Station, Antarctica: implications for policy of the government of The Netherlands
Principal Investigator:	Prof.dr. H.J.W. de Baar (University of Groningen)
Main Activity/ Remarks:	<p>This new Netherlands Polar Program (NPP) policy-oriented research proposal aims for a 6th project in the context of the 5 existing Netherlands projects at Rothera Research Station, Antarctica. Human activity has caused rapidly increasing emission of carbon dioxide (CO₂) into the atmosphere. About half of the emitted CO₂ remains airborne and is the cause of global warming, most pronounced at the poles. The remainder of anthropogenic CO₂ is removed mainly by the oceans and to a lesser extent by the terrestrial biosphere (IPCC, 2007). Thus, oceanic uptake of ~40% of CO₂ emitted by mankind acts as buffer to the increasing atmospheric CO₂ concentrations. Unfortunately, this CO₂ uptake causes major changes in ocean chemistry that in turn affect plankton ecosystems. This is the other CO₂ problem, less well known than the CO₂-warming problem, but with conceivably major impact notably for ocean waters around Antarctica. The Southern Ocean including its coastal seas and bays comprises 14% of the surface of our planet and plays a key role in global climate in the past, present and future. Increasing CO₂ contents of Antarctic surface and deep waters is changing the CO₂ conditions for plankton with implications for the whole Antarctic ecosystem. We propose (i) seasonal time series of CO₂ in seawater in Marguerite Bay (Rothera), together with (ii) plankton biology experiments under future high-CO₂ conditions, and (iii) policy for sustainability of Antarctica by our government policy (Regeerakkoord 2012) for reducing worldwide CO₂ emissions, with our policy research emphasis on emerging economies and The Netherlands.</p>

Operating Period:	From: 18 Nov 2014 To: 11 Apr 2015
	Areas of Operation
	Rothera

Project Name/Number:	866.14.102
Discipline:	Individual project under Netherlands Polar Programme: Impacts of marine vertebrates on Antarctic terrestrial food webs and nutrient cycling in an era of climate change
Principal Investigator:	Prof. dr. M.A.P.A. Aerts (Free University Amsterdam)
Main Activity/ Remarks:	<p>The functioning of terrestrial Antarctic ecosystems is not only determined by low temperatures, but also by low nutrient availability. An important local source of nutrient input to terrestrial ecosystems is the deposition of faeces and urine by marine vertebrates such as penguins and seals. These high nutrient inputs may at a local scale have much stronger impacts than the direct effects of climate warming. However, little is known of the impact of marine vertebrates on the structure and functioning of the terrestrial food webs in deglaciated areas of the Antarctic Peninsula and on nutrient cycling in these terrestrial ecosystems. The aim of this study is to investigate how concentrations of marine vertebrates (e.g. penguin rookeries, elephant and fur seal haul outs and resting areas) affect nitrogen dynamics and the structure and functioning of the terrestrial food web, and how this may interact with the direct effects of climate warming. At sites in the vicinity of Rothera Research Station we will determine N inputs due to vertebrate presence and study the impact on N transfer in the soil food web and on the structure and composition of the food web. We will compare these effects with those of climate warming using our established long-term climate manipulation experiment near Rothera, and new short-term warming experiments that we will combine with N amendment experiments. This project will be one of the first to analyze in detail the linkages between marine and terrestrial Antarctic ecosystems in the context of climate change.</p>
